**November 2019 Groundwater Monitoring Quarterly Report**

Project Number 60476644

From Thomas Parece, P.E., AECOM Project Manager

Date February 8, 2020

---

### 1. Executive Summary

The Eldredge Parkway Demonstration Test Permeable Reactive Barrier (PRB) was installed at the parking lot area southwest of the Nauset Middle School in November 2016. Baseline groundwater monitoring was completed before the PRB installation. Groundwater monitoring since implementation has included sampling events in 2017 (January, March, June and September), 2018 (January, April and September), and 2019 (January, April, July, and November). The results of the November 2019 groundwater monitoring event are presented in this memorandum.

This memorandum is the fourth to present new data since the PRB was modified by extending it to the north in June 2018. A portion of the area originally targeted for assessment of PRB performance to the north of the PRB installed in 2016 had been found to be outside of the area of influence of the PRB due a difference in groundwater flow direction in this northerly area. Consistent with the Adaptive Management Approach, a modification of the Demonstrations Test PRB was implemented. This modification included extending the PRB treatment line to the north to intercept and treat nitrate in groundwater along this untreated flow path.

While groundwater flow at the location has been found to be complex, some clear trends have developed that provide for interpretation of PRB performance to date. Based on multiple lines of evidence including 1) observed groundwater flow direction, 2) dissolved organic carbon concentrations (DOC) in groundwater derived from the injected PRB emulsified vegetable oil (EVO) substrate, 3) reductions in nitrate concentration, and 4) changes in redox conditions, the PRB is performing well in the monitored area downgradient of the PRB. Monitoring wells within the groundwater time of travel downgradient of the PRB extension line indicate almost complete removal of nitrate in groundwater, reduced redox conditions, and observed initial increases in DOC concentrations consistent with effective PRB nitrate treatment.

## 2. Background

This purpose of this technical memorandum is to provide an update of quarterly groundwater monitoring results as part of the Eldredge Parkway Permeable Reactive Barrier demonstration program. In addition to presenting baseline and quarterly groundwater monitoring data, this memorandum also summarizes PRB construction with emulsified vegetable oil (EVO) substrate injections for the Eldredge Park demonstration test site. AECOM Technical Services, Inc. (AECOM) PRB Technical Team (AECOM and MT Environmental Restoration) prepared this technical memorandum for the Town of Orleans. AECOM is providing water quality and wastewater planning and engineering services to the Town to reduce excessive nitrogen loading to the Town's ponds, estuaries and embayments.

## 3. Introduction

- A. The full Project represents the first to implement a "Hybrid" approach under the Cape Cod 208 Water Quality Plan, which has been approved by both the United States Environmental Protection Agency (USEPA) and the Massachusetts Department of Environmental Protection (MassDEP). The Project goal is to reduce the nitrate load to impacted estuaries in the most cost-effective manner by maximizing the use of several non-traditional technologies (Coastal Habitat Restoration, Aquaculture, and Permeable Reactive Barriers) in combination with limited centralized wastewater treatment.
- B. PRBs are a non-traditional treatment technology with the potential to reduce the levels of nitrate in the groundwater by treating groundwater biologically before it reaches sensitive surface water bodies such as estuaries.
- C. The results of the demonstration will be incorporated into an overall Adaptive Management Plan which will be implemented to evaluate the impacts of the selected technologies to reduce nitrogen loading to surface water. AECOM will continue to work closely with the Town and the regulatory agencies including the Cape Cod Commission (CCC) and MassDEP, in implementing the Adaptive Management Plan as it is critical to obtaining one of the first watershed permits granted by MassDEP.
- D. The PRB Demonstration Test aims to provide data to assess the cost effectiveness and applicability of PRBs as a treatment alternative for the Town. It is expected that the test will demonstrate the level of nitrate removal that can be achieved with PRBs and provide data to prepare a full-scale design. The Demonstration Tests will be evaluated by the following performance objectives:
  - 1) Achieve satisfactory distribution of the EVO substrate into the subsurface soils;
  - 2) Establish and maintain necessary dissolved organic carbon concentrations and anaerobic (reducing) conditions in the groundwater while maintaining groundwater flow throughout the targeted treatment area;
  - 3) Demonstrate reduced nitrate concentrations and the mass of nitrate transported in groundwater (nitrate flux) through groundwater monitoring;
  - 4) Evaluate performance through compliance monitoring and assessment of treated water quality, including potential secondary water quality affects, through a groundwater monitoring program;
  - 5) Evaluate the life expectancy of the EVO and time frame for technology performance;
  - 6) Evaluate potential impacts to sensitive receptors (surface water, private wells, etc.); and
  - 7) Obtain data for engineering evaluations and to optimize full scale design and implementation to meet nitrate reduction targets.

#### 4. Demonstration Test Location

- A. The Eldredge Parkway Demonstration Test site is located in the parking lot area between the Nauset Middle School playing fields and the Town-owned Eldredge Park baseball field. The demonstration site is owned by Nauset Public Schools. The Nauset Regional School Committee granted permission to install monitoring wells and conduct the PRB Demonstration Test at this location. Town Cove is located approximately 2,400 feet to the northeast of the PRB Demonstration Test site. Groundwater in this area generally flows in a northeasterly direction, toward Town Cove (Figure 1). Localized variation in groundwater flow direction has been observed at the Demonstration Test site with flow to the northeast and flow to the east southeast.
- B. Existing groundwater monitoring wells were identified at the Nauset Regional Middle School (NRMS) in the recreational field and parking lot area providing background groundwater quality data. These wells were installed in 1992 as part of an ongoing program to monitor groundwater in the vicinity of the NRMS wastewater treatment facility's leaching fields. An irrigation well for Eldredge Park was also identified near the corner of Eldredge Park and South Orleans Road with an available boring log and groundwater quality data.

#### 5. Demonstration Test Overview

##### A. PRB Treatment Process Description

- 1) PRBs are a passive treatment technology, designed in this application to intercept and treat nitrate in groundwater through biological denitrification before groundwater reaches downgradient surface waters. The PRB treatment zone is located in the groundwater saturated zone below the water table, where amendments are injected along a line to form the PRB. PRBs are typically oriented perpendicular to the direction of groundwater flow and rely on the natural groundwater gradient to carry the contaminant through the PRB (ITRC, 2011). The system is permeable because the amendments added are designed not to interfere with groundwater flow.
- 2) The PRB in-situ (in place in the ground) treatment method typically introduces a carbon food substrate into the aquifer, allowing naturally occurring microbes in the aquifer to consume the carbon substrate while respiring oxygen and creating anoxic conditions (without oxygen) favorable for denitrifying bacteria. Under anoxic or anaerobic conditions, maximum energy is gained by microbes using nitrate as an electron acceptor (denitrification reaction). Nitrate is the preferred electron acceptor to soil microbes after dissolved oxygen in the groundwater is consumed. This process of bacterial metabolism results in the conversion of nitrate to inert nitrogen gas and requires both anoxic conditions and sufficient food substrate for bacterial growth.

##### B. Demonstration Test Layout

The initial PRB Demonstration test line (November 2016) was oriented northwest to southeast (perpendicular) to the northeasterly regional groundwater flow direction and was approximately 110 feet long. Future full-scale PRBs or sections or PRBs are anticipated to be longer (500 to 3,000 feet, depending on the location). Demonstration Test locations are shorter in length, selected to assess construction/implementation, and allow intensive monitoring of groundwater conditions in the vicinity of the PRB. A 30 foot vertical treatment interval was selected extending down from near the top of the groundwater table into saturated soils for the initial Demonstration Test PRB line. Additional injection details are included in Table 5-1.

**Table 5-1 - Summary of Design Parameters for Permeable Reactive Barrier Demonstration Test**

Parameter	November 2016 Demonstration	June 2018 Extension
Area Description	Parking lot between the playing fields at Eldredge Park	Eldredge Park edge of soccer field by the parking lot
Depth to Ground Water	Approximately 30 to 34 feet below grade	Approximately 30 to 34 feet below grade
Demonstration Test PRB Length	110 feet	110 feet
Injection Interval	38 to 68 feet below grade	32 to 70 feet below grade
Injection Point Spacing	10 feet	10-foot 2-row grid (5-6 foot plus radius of influence)
Injection Points	17	20
Injection Pore Volume	12 percent (assumed effective porosity of 25 percent)	12 percent (assumed effective porosity of 25 percent)
Total Injection Volume (gal)	10,800	14,800
Injection Volume Per Point (gal)	600 (Three points received 720, 820, 860 gal in order to use the remainder of the EVO.)	~750
Injection Flow Rate (gpm)		~4.62
EVO Dilution	15.5 percent	14.2 percent
Total 60% EVO (gal)	2,620	3,696
Total Lactate (gal)	0	225

The PRB Demonstration Test extension line installed in June 2018 was oriented to intercept flow coming more from the west in the area north of the existing PRB, and then flowing through part of the existing field of groundwater monitoring wells. The PRB extension included injection of emulsified vegetable oil (EVO) along a line approximately 110 feet long with 20 injection points in the grass area adjacent to the Middle School parking lot as shown on Figure 1. The south end of the injection line overlapped the previous PRB injection line, oriented northwest to southeast, installed in November 2016. The new injection points were oriented roughly south to north in two parallel offset rows. A 38-foot vertical treatment injection interval was selected extending down from near the water table in saturated soils for the PRB extension. The completed PRB line including the extension intercepts groundwater flow along a line approximately 200 feet in length, formed in a wide-angle V pattern to intercept groundwater flow from both the southwest and northwest. A Technical Memorandum with PRB extension construction details was completed in December 2018 (AECOM, December 2018).

**C. Reactive Amendment Application Method**

PRBs have been designed and implemented through several construction methods. During this demonstration test, direct-push methods were used place the EVO substrate in the subsurface. Direct-push injection is a method of soil boring modified with a down-hole injection screen and tubing used for placement of organic carbon electron donor EVO substrate. The direct-push injections are temporary injection points that are sealed following injection.

#### D. PRB Demonstration Test Substrate and System Details

An EVO solution with a larger droplet size was used during both injection events and was selected so that the EVO droplets will adhere to sand grains in the formation to minimize the advection, or distribution, of EVO after injection. EVO adheres to the sandy aquifer material in the treatment zone and provides a slow release of soluble organic carbon compounds that are distributed by advection, dispersion, and diffusion in groundwater. A larger droplet size also maximizes the persistence of the carbon substrate within the PRB. Terra System's 60 percent Large Droplet Slow Release EVO for Nitrate Reduction (SRS-NR) was used. The SRS NR is a modified formulation developed so that the emulsion is "stickier" to further reduce migration after injection and increase persistence. Sodium lactate was also added to the injection solution for the extension to supply additional quick release carbon substrate to jumpstart treatment. During both injection events, sodium bicarbonate was added as a pH buffer with the EVO in order to establish more favorable pH conditions for denitrifying bacteria. The 60 percent EVO solution was delivered to the site and additives were mixed with water making an approximately 15 and 14 percent EVO solution for injection in the November 2016 and June 2018 respectively. Representative PRB design parameters are summarized below:

PRB installation methodology and field injection activities are summarized in two installation reports (AECOM, March 2017 and AECOM, December 2018).

#### 6. Permitting

The EPA Underground Injection Control (UIC) Program is responsible for regulating the construction, operation, permitting, and closure of injection wells that place fluids underground for storage and disposal. The UIC Program requirements were developed by EPA and designed to be adopted by states. The Massachusetts Department of Environmental Protection (MassDEP) UIC Program is defined in 310 CMR 27.00: Underground Injection Control Regulations and details the regulation of injection of fluids within Massachusetts.

To implement the Demonstration Test with the initial injection in November 2016, a UIC permit application (MassDEP form BRPWS 06) was filed with MassDEP under the category "Aquifer Remediation." Similar injections of carbon substrates to enhance biodegradation of chemicals in groundwater have been commonly implemented in Massachusetts. Many of these sites are exempt from the UIC registration process if the injections are conducted for waste site cleanup in accordance with the Massachusetts Contingency Plan (MCP, 310 CMR 40.0000) or similar federal statutes. In implementing the Demonstration Test all injections associated with the PRB complied with the requirements of the Massachusetts UIC regulations and the MCP requirements, including all required monitoring. MassDEP issued UIC Registration ID#MAS41A224209-5B6 for the Demonstration Test in September 2016. Plans for the extension were provided to the MassDEP and MassDEP approved the PRB extension injection event under the existing UIC registration #MAS41A224209-5B6 in April 2018.

#### 7. PRB Demonstration Test Performance Monitoring

##### A. General

Performance monitoring of the PRB Demonstration Test is being implemented to assess nitrate reduction, concentrations of biogeochemical indicators, and the distribution of the injected reagents. The monitoring program is designed to be dynamic and modified to respond to observations, adjusting the monitoring as necessary.

Groundwater samples are collected from selected monitoring wells in the Demonstration Test area. The monitoring well network includes multi-level monitoring wells and single monitoring wells upgradient and downgradient of the PRB within the regional flow system. These wells were originally aligned in two transects oriented from southwest to northeast with additional monitoring wells located cross gradient in the vicinity of the PRB and more regional monitoring wells around the PRB area. Additional monitoring wells have been installed to evaluate placement of the PRB extension and now form a third monitoring transect oriented northwest to southeast. The monitoring network plan view is presented on Figure 1 and PRB monitoring well transects are shown on Figure 2. Cross sections Transect 1 A-A', Transect 2 (B-B', and Transect 3 (C-C' are shown with nitrate data on Figure 3,

Figure 4, and Figure 5, respectively. Transect 3 Cross section C-C' will help assess performance of the PRB extension implemented in June 2018. The monitoring wells upgradient and downgradient of the PRB are used to evaluate changes to nitrate concentrations and groundwater quality based on PRB performance. Monitoring wells downgradient of the PRB are located at selected distances from the PRB along the transects to assess distance of emulsion travel, extent of reducing conditions for denitrification, and the potential for metals mobilization. The wells are also used for collection of groundwater elevation data for monitoring groundwater flow.

## **B. Sampling Method, Frequency, and Analyses**

Groundwater samples are collected using a submersible pump. Groundwater quality parameters measured in the field include pH, oxidation reduction potential (ORP), dissolved oxygen (DO), specific conductivity, temperature, and turbidity. Field parameters are monitored with the use of a multi-parameter probe in a flow-through cell. Samples are collected after field water quality parameters stabilize.

Groundwater samples were collected prior to EVO injection to provide a comparative baseline to evaluate performance of the Demonstration Test. Baseline groundwater samples were analyzed to determine pre-treatment concentrations of nitrate and other indicator parameters. Concentration change in the treatment area relative to concentrations at upgradient monitoring wells is indicative of the impact of the PRB. Several synoptic water level monitoring events were conducted prior to the start of injections to assess the groundwater flow direction and gradient. Monitoring well construction details are provided in Table 1 and elevation data is included in Table 2.

The first post-injection sampling event following the initial PRB injection was a stand-alone sampling event approximately 7 weeks after the injections with samples collected on January 5, 2017 and January 10, 2017. Following first post injection sampling, groundwater sampling is being performed quarterly for a projected period of three years. Primary objectives of the post-injection sampling are to:

- 1) Assess potential reduction in nitrate concentrations in groundwater compared to baseline samples and/or wells upgradient of the PRB;
- 2) Identify distance traveled by EVO emulsion and DOC;
- 3) Identify extent of generated reducing conditions;
- 4) Evaluate potential for reduction in aquifer permeability as a result of EVO application;
- 5) Evaluate persistence of EVO emulsion and anaerobic conditions favorable for denitrifying bacteria after PRB injection; and
- 6) Assess changes in groundwater monitoring parameters as a result of the PRB.

As a result of the generation of reducing conditions in groundwater, temporary mobilization of some metals native to the aquifer material may result. Table 7-1 presents an overview of the Demonstration Test performance monitoring analyses and relevance to the PRB Demonstration Test. The monitoring program was designed to be dynamic and continuously evaluated to adjust the selected monitoring parameters and frequency of monitoring based on data collected and observations.

**Table 7-1 - Summary of Potential Analyses for Groundwater Performance Evaluation**

<b>Parameter</b>	<b>Relevance to PRB Demonstration Test</b>
Nitrate	Primary groundwater compound targeted for treatment.
Nitrite	Intermediate nitrogen species from the aerobic nitrification of ammonia to nitrate.
Ammonia	Reduced inorganic nitrogen species that occurs in proximity of septic system leach fields and landfills.
TKN	Total Kjeldahl Nitrogen (TKN) is the total concentration of organic nitrogen and ammonia.
Total Nitrogen	Analyses provide a summation of all organic and inorganic nitrogen species in groundwater as a result of leach fields and landfill.
Metals (Fe, Mn, As)	Mobility of metals can be impacted by groundwater geochemistry changes, notably pH and ORP.
DOC	Dissolved Organic Carbon (DOC) is the limiting factor in enhancing denitrification-and is increased by injection of EVO. DOC tracks the area of influence of the PRB.
Sulfate	Sulfate will decrease with generation of sufficiently anaerobic conditions favorable for sulfate-reducing bacteria.
pH	Denitrification optimal pH (6.0 and 8.5). Groundwater pH can decrease as a result of fermentation of injected carbon substrates.
ORP	Oxidation-reduction potential (ORP) will decrease with generation of reducing conditions following injection of carbon substrate.
Chloride	Chloride concentrations indicate potentially infiltrating stormwater.
Alkalinity	Denitrification reactions generate alkalinity (3.57 mg of CaCO <sub>3</sub> for each mg of nitrate reduced).
Boron	Boron is present in laundry detergents and is an indicator of groundwater flow emanating from leach fields.

**8. PRB Demonstration Test Performance Monitoring Results To Date**

**1) Historical Data**

A summary of baseline, post-injection, and prior quarterly sampling results is found in Appendix A.

**2) Q-10 November 2019**

The tenth post-injection quarterly sampling (Q-10) event occurred on November 5-7, 2019, approximately 36 months after the first injections (November 2016) and approximately 17 months after the extension injections (June 2018). During the November 2019 quarterly sampling event, groundwater samples were collected from 37 monitoring wells and analyzed for nitrate, nitrite, ammonia, total nitrogen, chloride, sulfate, and the majority of monitoring wells were analyzed for DOC, dissolved iron, and dissolved manganese. Four monitoring wells were also analyzed for arsenic and methane. Parameters, such as water level, pH, temperature, DO, ORP, conductivity, and turbidity, were also measured in the field. Additionally, water levels were collected from six monitoring wells outside of the core monitoring well network.

## a) Assessment of Groundwater Flow Through the PRB November 2019

Groundwater elevations calculated from the November 2019 data were interpolated using Golden Software's Surfer program to develop groundwater contour lines (Figure 6, Figure 7, and Figure 8). These groundwater contour and flow direction interpretations continue to show a significant effect from local recharge and groundwater mounding in the parking lot area. Generally, groundwater flow is from west to east from the northern end of the soccer field and through the PRB to the parking lot area. Under the parking lot the flow direction shifts around to include localized flow to the south-southeast from the northern end of the parking lot where a large stormwater recharge gallery is located. The average groundwater flow through the PRB is from west to east with a net groundwater velocity of 0.2 to 0.3 feet/day. Significant precipitation events resulting in stormwater recharge are likely to continue to induce periodic temporal changes in horizontal flow direction and may also affect vertical groundwater flow.

## b) Assessment of Groundwater Chemistry Data and PRB Performance

Nitrate concentration and additional groundwater chemistry data for baseline and quarterly sampling has been updated with data from the November 2019 sampling event and is included in Table 3. Nitrate data is also shown on cross-sections in Figures 3, Figure 4 and Figure 5. Graphs showing nitrate and DOC concentrations along with ORP are shown for selected monitoring wells in Chart 1 through Chart 10.

Overall assessment of PRB performance demonstrates that the PRB is effectively reducing significant nitrate concentrations, up to 39 mg/L, to low concentrations or to below the detection limits of 0.03 mg/L mg/L in the downgradient treated area. The observed treated area appears to be expanding further downgradient with groundwater transport over time. Prior to the PRB extension injections in June 2018, data indicated effective PRB treatment downgradient of the November 2016 PRB section was limited to a wedge-shaped area bounded by the southeast to northwest oriented PRB section and including downgradient monitoring wells MW-B1010C (Chart 1), MW-B2010C (Chart 2), MW-B2020B (Chart 5), and MW-B2020C (Chart 6). These monitoring wells were close enough to the original southeast to northwest oriented PRB to be downgradient of the PRB in the easterly groundwater flow field.

Available data at the time of installation of the original section of PRB had indicated groundwater flow from southwest to northeast. The groundwater flow direction was later refined with data from additional monitoring well installations. The addition of the north-south PRB extension crossing the northwest end of the original PRB section has resulted in an expanded treatment area, extending to the north and affecting a significantly larger area including additional downgradient monitoring wells as discussed below. Data visualization heat maps showing the flow direction and concentration of nitrate in the vicinity of the PRB for shallow, intermediate and deep groundwater are shown in Figures 9, 10 and 11 respectively. There are no indications of nitrate breakthrough at the PRB and nitrate mass flux has been cut off. The effectiveness of PRB treatment is based on multiple lines of evidence including:

- Observation of the groundwater flow direction,
- Reduced concentrations of nitrate,
- Lower redox conditions (ORP) more favorable to denitrification, and
- Increased DOC concentrations indicating release of organic carbon from the PRB.

The last Quarterly data set from November 2019 was collected approximately 17 months following the PRB extension injections. Multiple lines of evidence as seen in Figures 9, 10, and 11, indicate treated groundwater has migrated more than 30 feet downgradient from the June 2018 PRB extension reaching monitoring wells MW-B1020B (Chart 3), MW-B1050A (Chart 7) and MW-B1050B (Chart 9). Limited evidence including a trend of lower nitrate concentration and decreased ORP observed at monitoring wells MW-B2050B and MW-B2050A also indicate treatment extending approximately 90 feet downgradient in intermediate and deep groundwater (see Chart 10 and Chart 8). The November 2016 PRB injections continue to affect treatment at shallow monitoring wells MW-B2010C (Chart 2) and MW-B2020C (Chart 6).

Additional observations were noted to develop a more complete understanding of groundwater flow dynamics and interpret performance data. Elevated concentrations of ammonia have been observed in monitoring well MW-B1075B, MW-BM050B, and MW-BN1, located further to the north near the Middle School septic system dosing chamber. The presence of ammonia may indicate a wastewater leak in the vicinity of the dosing chamber. November 2019 groundwater contours indicate some groundwater mounding at the northern end of the parking lot as a result of infiltration of stormwater.

Secondary groundwater quality parameters associated with PRB nitrate treatment are being monitored. Groundwater samples were collected for arsenic analyses from selected monitoring wells in September 2018 and January/April/July/November 2019. The September 2018 sampling included upgradient monitoring wells MW-4 and MW-BX2A, MW-BX2B, and MW-BX2C and monitoring wells MW-2010C and MW-2020B downgradient of the PRB. Of the six monitoring wells sampled and analyzed for arsenic, five were non-detect (<0.025 mg/L). MW-B2010C, had a total arsenic concentration of 0.059 mg/L which above the arsenic Massachusetts Maximum Contaminant Level (MMCL) groundwater standard 0.010 mg/L if all the arsenic is assumed to be dissolved. MW-2010C is in the PRB treatment zone. Sample results indicate that the groundwater in the treatment zone is anaerobic under reducing condition with a negative oxidation-reduction potential; some mobilization of naturally occurring metals (iron, manganese and arsenic) is expected. These metals are expected to precipitate downgradient after only limited migration. Monitoring well MW-B2010C was retested for total arsenic in January, April, July, and November 2019 and showed similar concentrations at 0.055, 0.087, 0.09, and 0.063 mg/L, respectively. Monitoring wells located further downgradient, including nearby MW-2020B and monitoring wells MW-BC3B, MW-BC4A, MW-BC4B, and MW-BC4C were tested for arsenic in January 2019 and all showed less than the detection limit (<0.025 mg/L), indicating arsenic had not migrated downgradient beyond the PRB treatment zone. MW-B2020B, MW-BC3B, and MW-BC4B were tested again in April and July 2019 and still all showed less than the detection limit. MW-BC3B and MW-BC4B were both tested in November 2019 and were non-detect (<0.05 mg/L). MW-B1020C showed an arsenic concentration of 0.05 mg/L. Two monitoring wells including MW-B1020C (close downgradient to the PRB) and sentinel MW-BC3B (~110 feet downgradient) are examples for monitoring results for secondary water quality parameters. Groundwater test results for secondary compounds from November 2019 shown on Chart 11 indicate elevated levels of dissolved iron, manganese, and total arsenic close to the PRB. The dissolved iron and manganese are elevated close to the PRB but are either not detected or at low level in the downgradient well. The total arsenic concentration was elevated at MW-B1020C but was not detected in the downgradient monitoring well. Methane is also periodically monitored to assess for carbon fermentation byproducts. Methane analyses indicate the maximum detected concentration was found at monitoring well MW-B2010C in November 2019 at a concentration of 3.45 mg/L, which is far below the 30 mg/L solubility of methane in water and below any level of concern.

## 9. Summary, Schedule, and Coordination

The groundwater data collected in November 2019 indicates that the PRB treatment area as defined by increased DOC concentrations, decreased oxidation-reduction potential, and reduced nitrate concentrations has been expanded to the north with the installation of the PRB extension.

The current proposed plan includes collecting quarterly samples through Fall 2020 with the next quarterly monitoring event in February 2019. Periodic reporting will be conducted to share results and observations with the Town, regulatory agencies, and the public.

1. DO was measured in the field as

DO(%) and was converted using the

online tool at:

<http://www.fbuehrer.ch/Rechner/O2sat>

ur.html

2. MW-12C references "MW-12" that

was installed as part of the Nauset

Regional Middle School monitoring well

network.

3. Existing wells (MW-4, MW-8, MW-

12C) screen elevations were

determined based on field

measurement of depth to bottom of

well. Actual screen depths may vary if

bottom was affected by silt build-up in

well.

4. MW-12C (existing) was damaged

during snow removal at the site in

Winter 2017. A sample was unable to

be taken during subsequent events. It

was repaired in April 2018.

5. MW-B2020B nitrate was re-tested.

1. DO was measured in the field as

DO(%) and was converted using the

online tool at:

<http://www.hbuehrer.ch/Rechner/O2sat.html>

2. MW-12C references "MW-12" that was installed as part of the Nauset Regional Middle School monitoring well network.

3. Existing wells (MW-4, MW-8, MW-12C) screen elevations were determined based on field

measurement of depth to bottom of well. Actual screen depths may vary if bottom was affected by silt build-up in well.

4. MW-12C (existing) was damaged during snow removal at the site in Winter 2017. A sample was unable to be taken during subsequent events. It was repaired in April 2018.

5. MW-B2020B nitrate was re-tested.

1. DO was measured in the field as

DO(%) and was converted using the

online tool at:

<http://www.fbuehrer.ch/Rechner/O2sat.html>

2. MW-12C references "MW-12" that was installed as part of the Nauset Regional Middle School monitoring well network.

3. Existing wells (MW-4, MW-8, MW-12C) screen elevations were determined based on field

measurement of depth to bottom of well. Actual screen depths may vary if bottom was affected by silt build-up in well.

4. MW-12C (existing) was damaged during snow removal at the site in Winter 2017. A sample was unable to be taken during subsequent events. It was repaired in April 2018.

5. MW-B2020B nitrate was re-tested.

1. DO was measured in the field as

DO(%) and was converted using the

online tool at:

<http://www.fbuehrer.ch/Rechner/O2sat>

ur.html

2. MW-12C references "MW-12" that

was installed as part of the Nauset

Regional Middle School monitoring well

network.

3. Existing wells (MW-4, MW-8, MW-

12C) screen elevations were

determined based on field

measurement of depth to bottom of

well. Actual screen depths may vary if

bottom was affected by silt build-up in

well.

4. MW-12C (existing) was damaged

during snow removal at the site in

Winter 2017. A sample was unable to

be taken during subsequent events. It

was repaired in April 2018.

5. MW-B2020B nitrate was re-tested.

1. DO was measured in the field as mg/L and was converted using the

online tool at: <http://www.fbuehrer.ch/Rechner/O2sat.html>

2. MW-12C references "MW-12" that was installed as part of the Nauset Regional Middle School monitoring well network.

3. Existing wells (MW-4, MW-8, MW-12C) screen elevations were determined based on field measurement of depth to bottom of well. Actual screen depths may vary if bottom was affected by silt build-up in well.

4. MW-12C (existing) was damaged during snow removal at the site in Winter 2017. A sample was unable to be taken during subsequent events. It was repaired in April 2018.

5. MW-B2020B nitrate was re-tested.

1. DO was measured in the field as

DO(%) and was converted using the

online tool at:

<http://www.fbuehrer.ch/Rechner/O2sat>

ur.html

2. MW-12C references "MW-12" that

was installed as part of the Nauset

Regional Middle School monitoring well

network.

3. Existing wells (MW-4, MW-8, MW-

12C) screen elevations were

determined based on field

measurement of depth to bottom of

well. Actual screen depths may vary if

bottom was affected by silt build-up in

well.

4. MW-12C (existing) was damaged

during snow removal at the site in

Winter 2017. A sample was unable to

be taken during subsequent events. It

was repaired in April 2018.

5. MW-B2020B nitrate was re-tested.

Notes:

- NS - Not Sampled
- Bold - detected above the Minimum Detection Limit
- 1. DO was measured in the field as DO(%) and was converted using the online tool at: <http://www.fbuehrer.ch/Rechner/O2sat.html>
- 2. MW-12C references "MW-12" that was installed as part of the Nauset Regional Middle School monitoring well network.
- 3. Existing wells (MW-4, MW-8, MW-12C) screen elevations were determined based on field measurement of depth to bottom of well. Actual screen depths may vary if bottom was affected by silt build-up in well.
- 4. MW-12C (existing) was damaged during snow removal at the site in Winter 2017. A sample was unable to be taken during subsequent events. It was repaired in April 2018.
- 5. MW-B2020B nitrate was re-tested.

**Appendix A**  
**Historical Monitoring Data**

This Page Intentionally Left Blank.

## Historical Monitoring Data

### A. Baseline Groundwater Monitoring

Baseline and cumulative quarterly field and laboratory test results are all shown in Table 3. Baseline groundwater monitoring samples were collected on October 4, 2016, November 3, 2016 and November 4, 2016. Baseline sampling indicated nitrate concentrations ranging from 0.357 mg/L (MW-BU2A) to 37 mg/L (MW-1050A) and generally aerobic redox conditions.

### B. Monitoring during Initial Injection Activities (November 2016)

During the demonstration injections, field parameters were monitored at select upgradient and downgradient wells. Overall, no distinct patterns between the field parameters (temperature, pH, dissolved oxygen, conductivity, and turbidity) were observed before, during, and immediately following the injections

Laboratory dilutions were completed by Terra Systems producing stock solutions of EVO at various dilutions to determine a reasonable correlation between turbidity and the estimated SRS-NR concentrations. Based on these dilutions and the turbidity measured, data suggests the potential for movement of the SRS-NR emulsion up to 20 feet from the injection at certain depths. However, the conductivity was variable and did not correlate to turbidity. Field visual observations did not indicate significant quantities of emulsion at the downgradient wells. There was potentially a dilute “milky” coloration to the groundwater at the 10-foot and 20-foot wells, however, these observations were soon followed by indications of “clearer” water. These observations support the target area distribution of EVO along the PRB. EVO was not observed following completion of injection indicating the injected material was stable and not migrating.

Groundwater samples were collected from seven wells on November 17, 2016 and analyzed for alkalinity and DOC. Alkalinity was measured as a potential indication of the pH buffer that was added with the injections and DOC was measured as a potential indication of the EVO. The alkalinity at the downgradient wells (MW-1010C, MW-1020C, MW-2010C, and MW-2020B) ranged from 11 to 20 mg/L, which is slightly higher than the upgradient and cross-gradient wells (MW-12C, MW-BC2C, and MW-BU2C), which ranged from 4 to 13 mg/L. DOC ranged from 0.576 to 0.852 mg/L and was similar for both upgradient/cross-gradient and downgradient wells.

### C. Initial Post-Injection Sampling (7 weeks)

A total of 14 groundwater samples were collected from select wells on January 5, 2017 and January 10, 2017. The wells sampled included upgradient wells MW-12A/B/C and MW-BU2A/B/C, cross-gradient well MW-BC2C, and downgradient wells MW-B1010C, MW-B1020B/C, MW-B1050A, MW-B2020B/C, and MW-B2050A. MW-B2010C was not sampled due to snow cover.

### D. Quarterly Sampling

#### 1) Q-1 February 2017

The first post-injection quarterly sampling event occurred on February 23, 2017 and February 24, 2017 (Q-1). Four additional monitoring wells were installed and sampled in March 2017 for supplementary assessment of groundwater flow direction and nitrate concentration.

The expected lag time from PRB injection to measurable nitrate reduction in groundwater immediately downgradient of the barrier is two to four months. During this time the EVO begins to increase DOC concentrations, stimulating biological activity, which leads to an increase in the biomass of desired nitrate reducing bacteria.

The February samples were collected approximately three months post injection. Shallow groundwater monitoring wells closest to the PRB (MW-B1010C and MW-B2010C) are located approximately ten feet downgradient of the injection zone (Figure 1). The February Quarter-1 (Q-1) sample at MW-B1010C indicated an increase in DOC from less than 1 mg/L during baseline sampling (November 2016) to 14 mg/L at Q-1. The MW-B1010C nitrate concentration decreased 27 percent from 13.6 at baseline to 9.94 mg/L at Q-1. Nitrate concentration data for baseline and quarterly sampling is included in Table 3 and on the cross-sections shown in Figures 3, 4 and 5.

Monitoring well MW-B2010C laboratory results also showed an increase in DOC concentrations. DOC increased from 2.2 mg/L at baseline to 19 mg/L at Q-1. Over the same period of time, the nitrate concentration decreased 68 percent from 15.7 to 5.06 mg/L.

Significant increases in DOC were not observed at other monitoring well locations and changes in nitrate concentration also did not appear to be significant with the exception of nitrate at monitoring well B1050A, where the nitrate concentration decreased 68 percent from 37 mg/L at baseline to 11.8 mg/L at Q-1.

No significant changes for dissolved iron and manganese were noted between the baseline and Q-1 sampling. Methane was not detected in groundwater at any of the locations sampled. These results indicate no significant impacts with respect to secondary water quality had occurred. No migration of EVO material was indicated by sampling observations or test results.

## 2) Q-2 June 2017

The second post-injection quarterly sampling (Q-2) event occurred on June 28, 2017 and June 29, 2017, approximately seven months post injection.

During the June 2017 quarterly sampling event, groundwater samples were collected from 24 monitoring wells and analyzed for nitrate, nitrite, ammonia, total nitrogen, chloride, sulfate, dissolved iron, dissolved manganese, total alkalinity, and DOC. Field-measured parameters, such as water level, pH, temperature, DO, ORP, conductivity, and turbidity, were also measured. MW-12C has not been repaired from the damage during snow removal and was unable to be sampled. Additionally, water levels were collected from 9 monitoring wells outside of the core monitoring well network.

### a) Assessment of Groundwater Flow Through the PRB June 2017

The initial PRB treatment line was composed of a series of injection points oriented northwest to southeast (perpendicular) to the northeasterly regional groundwater flow direction and is approximately 110 feet long. Depth to groundwater measurements at monitoring wells in the immediate vicinity of the PRB were completed prior to sampling during each monitoring event. The depth to water information was used to calculate water elevation and assess the direction of groundwater flow by developing contour maps of water level. Water elevation in shallow, intermediate depth, and deep wells were evaluated separately to assess flow direction at different depths.

Note that groundwater elevation can vary over time due to seasonal changes in groundwater recharge and can also change over the short term due to significant precipitation events. These changes can result in local variations in groundwater flow. Groundwater flow direction can also be in different directions at different depths below the water table, resulting in a complex 3-dimensional groundwater flow system.

MW-BX1B and MW-BX1C are intermediate and shallow wells that were installed in March 2017 approximately 20 feet northwest of where EVO was injected during the November 2016 demonstration initial injection activities. The purpose of installing MW-BX1B and MW-BX1C was to gather more information to get a better understand the groundwater flow pattern across the site and help with the interpretation of observed nitrate concentrations. High nitrate concentrations had been noted along the monitoring transects east of the selected location for these new monitoring wells (e.g. at MW-B1020C, MW-B1050B, MW-B1050A, and MW-B2020B) shown on Figure 1. No similar high nitrate concentrations were observed in monitoring wells upgradient to the southwest of the PRB (e.g. MW-12A, MW-12B, and MW-12C).

Groundwater elevations calculated from the June 2017 data were interpolated to develop groundwater contour lines and assess groundwater flow direction (See AECOM – Technical Memorandum for Eldredge Park Permeable Reactive Barriers Demonstration Project – Groundwater Monitoring Quarterly Report – Final dated February 5, 2018. Figure 6, Figure 7, and Figure 8). Based on this assessment, flow through the PRB did not appear to reach the full set of monitoring wells along the established monitoring well transects. Treated water may only be reaching the nearest monitoring wells on the north side and easterly of the PRB (e.g. MW-B1010C, MW-B2010C, MW-B2020B, and MW-B2020C). Monitoring wells further to the north along transects 1 and 2 also appeared to be affected by a local source of high nitrate concentration.

b) Assessment of Groundwater Chemistry Data June 2017

Groundwater sample locations closest to the initial PRB (MW-B1010C and MW-B2010C) are located approximately ten feet downgradient of the injection zone (Figure 1). The June Quarter-2 (Q-2) sample at MW-B1010C indicated an increase in DOC from 14 mg/L during Q-1 sampling (February 2017) to 17 mg/L at Q-2. Similarly, MW-B2010C indicated an increase in DOC from 19 mg/L during Q-1 to 83 mg/L during Q-2. The nitrate concentrations at MW-B1010C appear similar to baseline. The nitrate concentrations at MW-B2010C continued to show a concentration (5.7 mg/L) significantly below baseline (15.7 mg/L) and the oxidation-reduction potential (ORP) at MW-B2010C was negative, which indicates reducing conditions favorable to denitrification.

The DOC concentrations also increased slightly at the wells located approximately 20 feet from the injection points. MW-B1020B increased from 1.1 mg/L in Q-1 to 3.2 mg/L in Q-2, MW-B2020B increased from 1.0 mg/L in Q-1 to 3.5 mg/L in Q-2, MW-B2020C increased from 2 mg/L in Q-1 to 23 mg/L in Q-2.

Nitrate increased at upgradient monitoring wells MW-BX1B from 11.4 mg/L at Q-1 to 34.4 mg/L at Q-2, at MW-BX1C from 0.3 mg/L at Q-1 to 38.7 mg/L at Q-2. These high nitrate concentrations appear to be from a local source and are not within the target PRB treatment area.

Nitrate increased at MW-B1050A from 11.8 mg/L at Q-1 to 26.8 mg/L at Q-2, and at MW-B2020B from 14.8 mg/L at Q-1 to 22.4 mg/L at Q-2. While MW-B1050A and MW-B2020B both saw increases in nitrate concentrations, the shallow wells at those locations saw decreases in nitrate concentrations. Nitrate decreased at MW-B1050B from 28.7 mg/L at Q-1 to 18.2 mg/L at Q-2, at MW-B1050C from 4.0 mg/L at Q-1 to 3.3 mg/L at Q-2, and at MW-B2020C from 7.0 mg/L at Q-1 to 0.5 mg/L at Q-2.

Significant increases in DOC were not observed at other monitoring well locations and changes in nitrate concentration also did not appear to be significant.

It was also noted that dissolved iron increased from 1.8 mg/L at Q-1 to 24.2 mg/L at Q-2 and dissolved manganese increased from 0.2 mg/L at Q-1 to 1.6 mg/L at Q-2 in MW-B2010C. Dissolved iron increased from <0.1 mg/L at Q-1 to 8.0 mg/L at Q-2 and dissolved manganese increased from 0.1 mg/L at Q-1 to 1.0 mg/L at Q-2 in MW-B2020C. These two locations are also where the significant increases in DOC were observed. The increases in iron and manganese are also indications of the reducing conditions favorable to denitrification. No significant changes for dissolved iron and manganese were noted between the Q-1 and Q-2 sampling at other locations. Methane was not detected in groundwater at MW-B1010C but was present at 11.3 µg/L at MW-B2010C. This location demonstrated the highest increase in DOC and dissolved iron. No migration of EVO material was indicated by sampling observations or test results.

### 3) Q-3 September 2017

The third post-injection quarterly sampling (Q-3) event occurred on September 12, 2017 and September 13, 2017, approximately ten months post-injection. During the September 2017 quarterly sampling event, groundwater samples were collected from 24 monitoring wells and analyzed for nitrate, nitrite, ammonia, total nitrogen, chloride, sulfate, and DOC. Select groundwater samples were also analyzed for dissolved iron and dissolved manganese. Field-measured parameters, such as water level, pH, temperature, DO, ORP, conductivity, and turbidity, were also measured. Additionally, water levels were collected from 6 monitoring wells outside of the core monitoring well network.

#### a) Assessment of Groundwater Flow Through the PRB September 2017

Groundwater elevations calculated from the September 2017 data were interpolated to develop groundwater contour lines. These groundwater data indicated a similar pattern to the June 2017 contours and confirmed that flow through the initial PRB does not likely reach the full set of monitoring wells along the established monitoring well transects. Treated water may have only been reaching the nearest monitoring wells on the north side and easterly of the PRB. Monitoring wells along transects 1 and 2 further to the north also continued to be affected by a local source of high nitrate concentration originating upgradient to the west of MW-BX1B and MW-BX1C.

#### b) Assessment of Groundwater Chemistry Data

Groundwater sample locations closest to the PRB (MW-B1010C and MW-B2010C) are located approximately ten feet downgradient of the initial injection zone (Figure 1). The September Quarter-3 (Q-3) sample at MW-B1010C indicated an increase in DOC from 16.9 mg/L during Q-2 sampling (June 2017) to 21.4 mg/L at Q-3. MW-B2010C indicated a slight decrease in DOC from 83.3 mg/L during Q-2 to 69.4 mg/L during Q-3, however, this is still significantly elevated over the baseline DOC of 2.2 mg/L. The nitrate concentrations at MW-B1010C decreased to 2.5 mg/L at Q-3 compared to 13.6 mg/L at baseline. The nitrate concentrations at MW-B2010C showed a concentration (0.18 mg/L) well below baseline (15.7 mg/L) and the oxidation-reduction potential (ORP) at MW-B2010C was negative (-119.80 mV), which indicates more reducing conditions favorable to denitrification.

The DOC concentrations increased slightly at almost all other monitoring wells. The largest of these increases was noted at MW-2020B, which increased from 3.5 mg/L in Q-2 to 29.8 mg/L in Q-3 indicating this location was likely affected by the initial PRB. MW-2020B also showed a significant decrease in nitrate concentration from 22.4 mg/L in Q-2 to 6.0 mg/L in Q-3. Nitrate concentrations showed little to no change at most of the monitoring wells located 50 to 75 feet from the PRB along transect 1 (A to A'). Nitrate concentrations decreased slightly at the three 50-foot wells on Transect 2 (B to B'), with the largest decrease at MW-B2050A, from 32.8 mg/L in Q-2 to 25.5 mg/L in Q-3.

Groundwater nitrate concentrations increased at the upgradient monitoring well MW-BX1B from 34.4 mg/L at Q-2 to 39.0 mg/L at Q-3. The concentration at MW-BX1C remained high at 37.8 mg/L. These high nitrate concentrations appear to be from a local source and are not within the target PRB treatment area.

Dissolved iron increased at MW-1010C from 0.14 mg/L in Q-2 to 3.88 mg/L in Q-3. There was no major increase in dissolved manganese at this location. It was also noted that dissolved iron increased from 24.2 mg/L at Q-2 to 46.2 mg/L at Q-3 and dissolved manganese increased from 1.6 mg/L at Q-2 to 2.6 mg/L at Q-3 in MW-B2010C. Dissolved iron increased from 8.0 mg/L at Q-2 to 13.1 mg/L at Q-3 and dissolved manganese increased from 1.0 mg/L at Q-2 to 2.1 mg/L at Q-3 in MW-B2020C. Increases in iron and manganese are also indications of the reducing conditions favorable to denitrification. No significant changes for dissolved iron and manganese were noted between the Q-2 and Q-3 sampling at other locations where analyzed. No migration of EVO material was indicated by sampling observations or test results.

#### 4) Q-4 January 2018

The fourth post-injection quarterly sampling (Q-4) event occurred on January 8, 2018 through January 10, 2018, approximately fourteen months following the initial injection. During the January 2018 quarterly sampling event, groundwater samples were collected from 24 monitoring wells and analyzed for nitrate, nitrite, ammonia, total nitrogen, chloride, sulfate, DOC, dissolved iron and dissolved manganese. Two select wells were also analyzed for boron. Field-measured parameters, such as water level, pH, temperature, DO, ORP, conductivity, and turbidity, were also measured. Water levels were also collected from seven monitoring wells outside of the core monitoring well network.

##### a) Assessment of Groundwater Flow Through the PRB January 2018

Groundwater elevations calculated from the January 2018 data were interpolated to develop groundwater contour lines. The groundwater data again indicated a similar groundwater flow pattern to that observed in June 2017 and September 2017. These data again confirmed that flow through the PRB does not appear to reach the full set of monitoring wells along the established monitoring well transects and treated water may only be reaching the monitoring wells approximately 20 feet north of the PRB due to groundwater flow directions.

##### b) Assessment of Groundwater Chemistry Data

Nitrate concentrations at sample locations closest to the initial PRB, including MW-B1010C on Transect 1 (A-A') and MW-B2010C on Transect 2 (B to B'), appear to be significantly reduced by the PRB. Graphs of nitrate and DOC concentrations show generally decreasing nitrate concentration trends and increasing DOC concentration trends. Decreasing nitrate concentrations and increasing DOC concentrations provide two lines of evidence for PRB performance. The January Quarter-4 (Q-4) sample at MW-B1010C indicated a slight decrease in DOC from 21.4 mg/L at Q-3 to 13.6 mg/L at Q-4. MW-B2010C indicated an increase in DOC from 69.4 mg/L during Q-3 to 94.3 mg/L in Q-4. The nitrate concentrations at MW-B1010C increased slightly to 2.76 mg/L, which is still well below the baseline concentration of 13.6 mg/L. The nitrate concentrations at MW-B2010C was below detection at <0.03 mg/L, dissolved oxygen was less than 0.5 mg/L, and the oxidation-reduction potential (ORP) at MW-B2010C was negative (-102.1 mV), all indicators of reducing conditions favorable to denitrification.

The monitoring wells located 20 feet from the initial PRB including MW-B1020B and MW-B1020C on Transect 1 (A to A'), and MW-2020B and MW-2020C on Transect 2 (B to B') also appeared to be significantly affected by the PRB with increased DOC concentrations and decreased nitrogen concentrations. Dissolved iron increased at MW-1010C from 3.88 mg/L in Q-3 to 9.69 mg/L in Q-4. There was no major increase in dissolved manganese at this location. It was also noted that dissolved iron increased from 46.2 mg/L at Q-3 to 88.2 mg/L at Q-4 and dissolved manganese increased from 2.6 mg/L at Q-3 to 5.2 mg/L at Q-4 in MW-B2010C. The increases in iron and manganese are also indications of the reducing conditions favorable to denitrification. No migration of EVO material was indicated by sampling observations or test results.

Nitrate concentrations also decreased at all monitoring wells located in the area approximately 50 feet north from the PRB. The largest decreases were at MW-1050A, from 26.7 mg/L in Q-3 to 4.89 mg/L in Q-4 and MW-B2050A, from 25.5 mg/L in Q-3 to 11.6 mg/L in Q-4. Nitrate was also noted to have decreased at the upgradient monitoring wells MW-BX1B and MW-BX1C from 39.0 mg/L at Q-3 to 10 mg/L at Q-4 and at MW-BX1C from 37.8 mg/L at Q-3 to 11.1 mg/L at Q-4. The lower nitrate concentrations in the area 50 feet north of the PRB were not associated with increased DOC concentrations. These nitrate test results are similar to concentrations observed during the first sampling event for MW-BX1B in March 2017. BX1B and MW-BX1C appear to be located upgradient from MW-1050A and MW-2050A based on groundwater contours. Changes in concentration in the area 50 feet north of the PRB are not likely associated with the initial PRB.

Nitrate concentration data for baseline and quarterly sampling is included in Table 3 and on the cross-sections shown in Figures 3, 4, and 5. Nitrate data are also included with January 2018 groundwater contours and flow direction for shallow, intermediate depth, and deep groundwater monitoring wells on Figure 6, Figure 7, and Figure 8 respectively, within the January 2018 Quarterly Report.

#### 5) Q-5 April 2018

The fifth post-injection quarterly sampling (Q-5) event occurred on April 18<sup>th</sup> and 19<sup>th</sup>, 2018, approximately 17 months post-injection. During the April 2018 quarterly sampling event, groundwater samples were collected from 25 monitoring wells and analyzed for nitrate, nitrite, ammonia, total nitrogen, chloride, sulfate, DOC, dissolved iron and dissolved manganese. Two select wells were also analyzed for boron. Parameters, such as water level, pH, temperature, DO, ORP, conductivity, and turbidity, were measured in the field. Water levels were also collected from several other monitoring wells outside of the core monitoring well network.

Concurrent with this quarterly sampling event, several monitoring wells were in the process of being installed and repairs were made to existing wells. These efforts included: repairing MW-1 and installing four triplet wells and one single screen well. These were installed at various locations to allow for better assessment of groundwater flow direction and were not yet developed or sampled as part of this event.

##### a) Assessment of Groundwater Flow Through the PRB April 2018

Groundwater elevations calculated from the April 2018 data were interpolated to develop groundwater contour lines. The groundwater data again indicated a similar groundwater flow pattern to that observed in June 2017 and September 2017. These data again confirmed that flow through the PRB does not appear to reach the full set of monitoring wells along the established monitoring well transects and treated water may only be reaching the monitoring wells up to 20 feet north of the initial PRB due to groundwater flow directions.

##### b) Assessment of Groundwater Chemistry Data

Nitrate concentration data for baseline and quarterly sampling is included in Table 3 and on the cross-sections shown in Figure 3, Figure 4 and Figure 5. Nitrate data are also included with April 2018 groundwater contours and flow direction for shallow, intermediate depth, and deep groundwater monitoring wells on Figure 6, Figure 7, and Figure 8 respectively within the April 2018 Quarterly Report.

Groundwater quality at the Transect 1 wells generally showed an increase in nitrate concentration. This increase in nitrate concentration was also observed at the upgradient monitoring wells MW-BX1B and MW-BX1C. This correlation further supports the observation that this area to the north is affected by a high concentrations source, likely the section of the Nauset Regional Middle School 1977 leaching pit wastewater infiltration system located under the north end of the soccer field.

In general, the wells near the eastern half of the PRB (MW-B2020C, MW-2020B, and MW-2020C) showed a correlating trend between elevated DOC and reduced nitrate concentrations compared with the wells on the western half of the PRB (MW-B1020C, MW-1020B). The nitrate concentration at MW-B2020B continued to decrease compared to previous sampling events. MW-B2010C and MW-B2020C nitrate concentrations remained below detection having been previously reduced by effective PRB treatment in this area.

#### 6) Q-6 September 2018

The sixth post-injection quarterly sampling (Q-6) event occurred on September 19, 2018, September 20, 2018, and September 25, 2018, approximately 22 months after the first injections (November 2016) and 3 months after the extension injections (June 2018). During the September 2018 quarterly sampling event, groundwater samples were collected from 38 monitoring wells and analyzed for nitrate, nitrite, ammonia, total nitrogen, chloride, sulfate, DOC, dissolved iron, and dissolved manganese. One additional monitoring well upgradient of the PRB was sampled and analyzed for select parameters. Several monitoring wells were also analyzed for arsenic. Parameters, such as water level, pH, temperature, DO, ORP, conductivity, and turbidity, were also measured in the field. Additionally, water levels were collected from monitoring wells outside of the core monitoring well network.

##### c) Assessment of Groundwater Flow Through the PRB September 2018

Groundwater elevations calculated from the September 2018 data were interpolated to develop groundwater contour lines (Figure 6, Figure 7, and Figure 8).

##### d) Assessment of Groundwater Chemistry Data

Nitrate concentration data for baseline and quarterly sampling is included in Table 3 and on the cross-sections shown in Figures 3, Figure 4 and Figure 5.

Nitrate concentrations at the Transect 2 wells generally had similar concentrations to the April 2018 event. MW-B2010C and MW-B2020C on Transect 2 were non-detect at both sampling events. MW-B2020B nitrate increased from 2.4 mg/L in April to 3.06 mg/L in September, however, this is still lower than all other prior sampling events indicating a downward trend.

The monitoring wells on Transect 1 closest to the 2016 PRB injection line overlap with those on Transect 3. Due to current understanding of groundwater flow direction and the decision to implement the PRB extension, Transect 3 will be used to assess PRB performance in this area going forward. Transect 3 wells closest to the PRB extension showed a significant decrease in nitrate concentration compared with the April 2018 data collected prior to the PRB extension injections in June 2018. Samples collected from MW-B1010C located approximately 10 feet downgradient of the PRB extension and MW-B1020B located approximately 20 feet downgradient of the PRB extension were non-detect for nitrate (<0.03 mg/L), compared with concentrations of 18.3 and 9.7 mg/L, respectively, in April 2018. The DOC concentration also increased significantly at these wells. The DOC increased from 13 mg/L in April to 321 mg/L in September at MW-B1010C and increased from 5.43 mg/L in April to 668 mg/L in September at MW-B1020B. MW-B1020C nitrate concentration decreased from 9.7 mg/L in April to 1.92 mg/L in September and the DOC increased from 6.02 mg/L to 45.5 mg/L.

MW-BX1B and MW-BX1C located in the PRB extension injection zone also had much lower nitrate concentration in September compared to April. MW-BX1B had a nitrate concentration of 28.5 mg/L in April and non-detect in September and MW-BX1C had a nitrate concentration of 27.7 mg/L in April and 5.77 mg/L in September. These wells are located near the upgradient edge of the PRB extension zone and are part of Transect 3 C-C'. Monitoring wells MW-BX2A, MW-BX2B, and MW-BX2C located approximately 45 feet upgradient of the PRB extension along Transect 3 had high nitrate concentrations in April (baseline for these newer wells) and again in September with concentrations of 10.8, 9.5, and 42.8 mg/L in September respectively. Samples were collected for arsenic analyses from six monitoring wells including upgradient monitoring wells MW-4 and MW-BX2A, MW-BX2B, and MW-BX2C; MW-BX1C located within the PRB extension injection areas; and monitoring wells MW-2010C and MW-2020B downgradient of the PRB. Of the six monitoring

wells sampled and analyzed for arsenic, five were non-detect (<0.0025 mg/L). MW-B2010C, had an arsenic concentration of 0.06 mg/L which above the arsenic Massachusetts Maximum Contaminant Level (MMCL) groundwater standard 0.010 mg/L. MW-2010C is in an area affected by the PRB. Sample results indicate that the groundwater is anaerobic under reducing condition with a negative oxidation-reduction potential and some mobilization of naturally occurring metals (iron, manganese and arsenic) is expected. These metals are also expected to precipitate downgradient where more aerobic conditions are encountered. Monitoring wells located further downgradient will be tested during the next sampling event to determine the extent of dissolved metal migration.

The observed DOC concentrations in groundwater can now be used to roughly estimate groundwater velocity through the treatment area. DOC is subject to biological degradation and therefore is not a conservative tracer. However, an approximation of groundwater velocity can be made with the data. Monitoring wells located up to 20 feet downgradient of the PRB extension were found to have significantly increased DOC concentrations. Groundwater sampling occurred approximately 90 days following the PRB extension injections indicating a groundwater velocity of at least 0.2 feet/day. Monitoring wells MW-B1050A, MW-B1050B, and MW-B1050C located approximately 30 feet downgradient have not shown increased DOC concentrations during this time frame indicating the groundwater velocity is less than 0.3 feet per day. Based on a groundwater velocity of 0.22 feet per day DOC concentration increases and potentially reduced nitrate concentrations can be expected at monitoring wells MW-B1050A and MW-B1050B, and MW-B1050C approximately 140 days following the PRB extension injections (by December 2018).

## 7) Q-7 January 2019

The seventh post-injection quarterly sampling (Q-7) event occurred on January 2-4, 2019, approximately 26 months after the first injections (November 2016) and approximately 6 months (185 days) after the extension injections (June 2018). During the January 2019 quarterly sampling event, groundwater samples were collected from 38 monitoring wells and analyzed for nitrate, nitrite, ammonia, total nitrogen, chloride, sulfate, DOC, dissolved iron, and dissolved manganese. Six monitoring wells were also analyzed for arsenic. Parameters, such as water level, pH, temperature, DO, ORP, conductivity, and turbidity, were also measured in the field. Additionally, water levels were collected from five monitoring wells outside of the core monitoring well network.

### a) Assessment of Groundwater Flow Through the PRB January 2019

Groundwater elevations calculated from the January 2019 data were interpolated using Golden Software's Surfer program to develop groundwater contour lines (Figure 6, Figure 7, and Figure 8 in the January 2019 report). These groundwater contour and flow direction interpretations continue to show a significant effect from local recharge and groundwater mounding. Generally, groundwater flow is from west to east in the soccer field area upgradient of the PRB with the flow direction shifting around to localized flow to the south-southeast at the northern end of the parking lot where a large stormwater recharge gallery is located. Groundwater chemistry data allows for additional interpretation of groundwater flow based on transport DOC downgradient from the PRB, and downgradient changes in geochemistry as a result of PRB induced reducing conditions. The interpretation based on groundwater chemistry shows the average groundwater flow through the PRB is from west to east with a net groundwater velocity of 0.2 to 0.3 feet/day. Significant precipitation events resulting in stormwater recharge are likely to induce periodic temporal changes in horizontal flow direction and may also affect vertical groundwater flow.

### b) Assessment of Groundwater Chemistry Data and PRB Performance

Nitrate concentration and additional groundwater chemistry data for baseline and quarterly sampling has been updated with data from the January 2019 sampling event and is included in Table 3. Nitrate data is also shown on cross-sections in Figures 3, Figure 4 and Figure 5. Graphs showing nitrate and DOC concentrations along with ORP are shown for selected monitoring wells in Chart 1 through Chart 9 in the January 2019 memorandum.

Overall assessment of PRB performance demonstrates that the PRB is now effectively reducing significant nitrate concentrations, up to 39 mg/L, to low concentrations or to below the detection limit of 0.03 mg/L in the downgradient treated area. Prior to the PRB extension injections in June 2018, data indicated effective PRB treatment downgradient of the November 2016 PRB section was limited to a wedge-shaped area bounded by the southeast to northwest oriented PRB section and including downgradient monitoring wells MW-B1010C (Chart 1), MW-B2010C (Chart 2), MW-B2020B (Chart 5), and MW-B2020C (Chart 6). These monitoring wells were close enough to the original southeast to northwest oriented PRB to be downgradient of the PRB in the easterly groundwater flow field.

Available data at the time of installation of the original section of PRB had indicated groundwater flow from southwest to northeast. The groundwater flow direction was later refined with data from additional monitoring well installations. The addition of the north-south PRB extension crossing the northwest end of the original PRB section has resulted in an expanded treatment area, extending to the north and affecting a significantly larger area including additional downgradient monitoring wells as discussed below. The apparent treatment area and groundwater flow directions are shown on Figure 9 of the January 2019 memorandum.

The effectiveness of PRB treatment is based on multiple lines of evidence including:

- Reduced concentrations of nitrate,
- Lower redox conditions (ORP) more favorable to denitrification, and
- Increased DOC concentrations indicating release of organic carbon from the PRB.

The last Quarterly data set from September 2018 was collected approximately 90 days following the PRB extension injections. The September data indicated that treated groundwater had migrated approximately 20 feet downgradient from the June 2018 PRB extension reaching monitoring wells MW-B1020B (Chart 3) and MW-B1020C (Chart 4). Spikes in DOC concentration in September likely represent initial release of DOC from the PRB that would have triggered an increase in the biomass of denitrifying bacteria. Lower but still significant DOC concentrations observed in January 2019 indicate increased biomass and consumption of released DOC downgradient of the PRB as expected (see Chart 3).

The January 2019 sampling event shows treated groundwater has now migrated approximately 30 feet downgradient from the June 2018 PRB extension reaching monitoring wells MW-B1050A (Chart 7) and MW-1050B (Chart 9). The shallowest monitoring well at this location, MW-1050C, has not shown any significant change except for a small increase in DOC concentration. Stormwater infiltration in the parking lot area where PRB performance monitoring wells are located appears to have a significant effect on horizontal and vertical groundwater flow direction based on water table elevation measurements and mounding observed in groundwater contour plots. These groundwater recharge conditions may account for the delay in treatment at MW-1050C.

The horizontal and vertical movement of groundwater has also been noted based on observations of nitrate plume migration. High concentration nitrate has been persistent at the monitoring wells upgradient of the 2018 PRB extension at MW-BX2A, MW-BX2B, MW-BX2C with average concentrations of 17, 16, and 39 mg/L nitrate respectively. Concentrations of nitrate between 2 and 5 mg/L are more typical locally so the path of this high concentration plume can be traced. Note that the A well screen is set deepest in the aquifer, B well screens are at an intermediate depth, and the C well are set at the water table as shown in cross-sections (Figures 3, Figure 4 and Figure 5). The highest average concentration 39 mg/L is near the water table and likely close to its source. The source of this high nitrate concentration plume appears to be the septic leaching galleries for the Middle School located under the northern end of the soccer field (see Figure 1). This high concentration nitrate plume was originally observed extending downgradient approximately 175 feet to the east to MW-B2050A. An average concentration of 27 mg/L nitrate was calculated for MW-B2050A based on data collected from November 2016 through September 2018. The shallower well screens at this

location had lower average concentrations. MW-B2050B, the mid-level screen, showed an average concentration of 4 mg/L, and the shallowest screen, MW-B2050C, showed an average nitrate concentration of 2.5 mg/L. These data indicate the high concentration nitrate plume is diving deeper as it migrates in an easterly direction under the parking lot influenced by stormwater recharge. This diving plume is significant because the same conditions will likely also drive the PRB treated groundwater deeper as it follows this easterly flow path, and this observation should be considered in the performance evaluation.

In an effort to evaluate secondary groundwater quality issues associated with PRB nitrate treatment, groundwater samples were collected for arsenic analyses from selected monitoring wells in September 2018 and January 2019. The September 2018 sampling included upgradient monitoring wells MW-4 and MW-BX2A, MW-BX2B, and MW-BX2C and monitoring wells MW-2010C and MW-2020B downgradient of the PRB. Of the six monitoring wells sampled and analyzed for arsenic, five were non-detect (<0.0025 mg/L). MW-B2010C, had an arsenic concentration of 0.059 mg/L which above the arsenic Massachusetts Maximum Contaminant Level (MMCL) groundwater standard 0.010 mg/L. MW-2010C is in the PRB treatment zone. Sample results indicate that the groundwater in the treatment zone is anaerobic under reducing condition with a negative oxidation-reduction potential and some mobilization of naturally occurring metals (iron, manganese and arsenic) is expected. These metals are also expected to precipitate downgradient where more aerobic conditions are encountered. Monitoring well MW-B2010C was retested for arsenic in January 2019 and showed a similar concentration at 0.055 mg/L. Monitoring wells located further downgradient, including nearby MW-2020B and monitoring wells MW-BC3B, MW-BC4A, MW-BC4B, and MW-BC4C were tested for arsenic in January 2019 and all showed less than the detection limit (<0.0025 mg/L), indicating arsenic was not migrating downgradient beyond the PRB treatment zone.

#### **8) Q-8 April 2019**

The eighth post-injection quarterly sampling (Q-8) event occurred on April 9-11, 2019, approximately 29 months after the first injections (November 2016) and approximately 10 months after the extension injections (June 2018). During the April 2019 quarterly sampling event, groundwater samples were collected from 37 monitoring wells and analyzed for nitrate, nitrite, ammonia, total nitrogen, chloride, sulfate, DOC, dissolved iron, and dissolved manganese. Four monitoring wells were also analyzed for arsenic. Parameters, such as water level, pH, temperature, DO, ORP, conductivity, and turbidity, were also measured in the field. Additionally, water levels were collected from six monitoring wells outside of the core monitoring well network.

##### **e) Assessment of Groundwater Flow Through the PRB April 2019**

Groundwater elevations calculated from the April 2019 data were interpolated using Golden Software's Surfer program to develop groundwater contour lines (Figure 6, Figure 7, and Figure 8). These groundwater contour and flow direction interpretations continue to show a significant effect from local recharge and groundwater mounding in the parking lot area. Generally, groundwater flow is from west to east from the northern end of the soccer field and through the PRB to the parking lot area. Under the parking lot the flow direction shifts around to include localized flow to the south-southeast from the northern end of the parking lot where a large stormwater recharge gallery is located. The persistent rainy conditions during the spring of 2019 produced significant groundwater mounding and additional localized flow to the south in April 2019. Groundwater chemistry data allows for additional interpretation of groundwater flow velocity based on transport DOC downgradient from the PRB, and downgradient changes in geochemistry as a result of PRB induced reducing conditions. The interpretation based on groundwater chemistry shows the average groundwater flow through the PRB is from west to east with a net groundwater velocity of 0.2 to 0.3 feet/day. Significant precipitation events resulting in stormwater recharge are likely to continue to induce periodic temporal changes in horizontal flow direction and may also affect vertical groundwater flow.

## f) Assessment of Groundwater Chemistry Data and PRB Performance

Nitrate concentration and additional groundwater chemistry data for baseline and quarterly sampling has been updated with data from the April 2019 sampling event and is included in Table 3. Nitrate data is also shown on cross-sections in Figures 3, Figure 4 and Figure 5. Graphs showing nitrate and DOC concentrations along with ORP are shown for selected monitoring wells in Chart 1 through Chart 10.

Overall assessment of PRB performance demonstrates that the PRB is now effectively reducing significant nitrate concentrations, up to 39 mg/L, to low concentrations or to below the detection limits of 0.03 mg/L or 0.21 mg/L in the downgradient treated area. The observed treated area is expected to expand further downgradient with groundwater transport over time. Prior to the PRB extension injections in June 2018, data indicated effective PRB treatment downgradient of the November 2016 PRB section was limited to a wedge-shaped area bounded by the southeast to northwest oriented PRB section and including downgradient monitoring wells MW-B1010C (Chart 1), MW-B2010C (Chart 2), MW-B2020B (Chart 5), and MW-B2020C (Chart 6). These monitoring wells were close enough to the original southeast to northwest oriented PRB to be downgradient of the PRB in the easterly groundwater flow field.

Available data at the time of installation of the original section of PRB had indicated groundwater flow from southwest to northeast. The groundwater flow direction was later refined with data from additional monitoring well installations. The addition of the north-south PRB extension crossing the northwest end of the original PRB section has resulted in an expanded treatment area, extending to the north and affecting a significantly larger area including additional downgradient monitoring wells as discussed below. Data visualization heat maps showing the flow direction and concentration of nitrate in the vicinity of the PRB for shallow, intermediate and deep groundwater are shown in Figures 9, 10 and 11 respectively.

The effectiveness of PRB treatment is based on multiple lines of evidence including:

- Observation of the groundwater flow direction,
- Reduced concentrations of nitrate,
- Lower redox conditions (ORP) more favorable to denitrification, and
- Increased DOC concentrations indicating release of organic carbon from the PRB.

The last Quarterly data set from April 2019 was collected approximately 308 days following the PRB extension injections. As seen in Figures 9, 10, and 11, treated groundwater has now migrated more than 30 feet downgradient from the June 2018 PRB extension reaching monitoring wells MW-B1020B (Chart 3), MW-B1050A (Chart 7) and MW-B1050B (Chart 9). The November 2016 PRB injections continue to affect treatment at shallow monitoring wells MW-B2010C (Chart 2) and MW-B2020C (Chart 6).

Additional observations were noted to develop a more complete understanding of groundwater flow dynamics and interpret performance data. MW-1075B appears to be significantly affected by groundwater flow from the north that includes elevated ammonia concentrations. Similar elevated concentrations of ammonia have been observed in monitoring well MW-BN1C, located further to the north near the Middle School septic system dosing chamber. The presence of ammonia may indicate a wastewater leak in the vicinity of the dosing chamber. April 2019 groundwater contours indicate the heavy precipitation experienced this spring has resulted in significant groundwater mounding at the northern end of the parking lot as a result of infiltration of stormwater. This mound has resulted in more flow to the south that may account for the slow progress of the front of treated groundwater that has not progressed to deeper downgradient monitoring wells MW-B2020B (Chart 2) and MW-B2050B (Chart 10).

Secondary groundwater quality affects associated with PRB nitrate treatment are being monitored. Groundwater samples were collected for arsenic analyses from selected monitoring wells in September 2018, January 2019, and April 2019. The September 2018 sampling included upgradient monitoring wells MW-4 and MW-BX2A, MW-BX2B, and MW-BX2C and monitoring wells MW-2010C and MW-2020B downgradient of the PRB. Of the six monitoring wells sampled and analyzed for arsenic, five were non-detect (<0.0025 mg/L). MW-B2010C, had an arsenic concentration of 0.059 mg/L which above the arsenic Massachusetts Maximum Contaminant Level (MMCL) groundwater standard 0.010 mg/L. MW-2010C is in the PRB treatment zone. Sample results indicate that the groundwater in the treatment zone is anaerobic under reducing condition with a negative oxidation-reduction potential and some mobilization of naturally occurring metals (iron, manganese and arsenic) is expected. These metals are also expected to precipitate downgradient where more aerobic conditions are encountered. Monitoring well MW-B2010C was retested for arsenic in January and April 2019 and showed a similar concentration at 0.055 and 0.087 mg/L, respectively. Monitoring wells located further downgradient, including nearby MW-2020B and monitoring wells MW-BC3B, MW-BC4A, MW-BC4B, and MW-BC4C were tested for arsenic in January 2019 and all showed less than the detection limit (<0.0025 mg/L), indicating arsenic had not migrated downgradient beyond the PRB treatment zone. MW-B2020B, MW-BC3B, and MW-BC4B were tested again in April 2019 and still all showed less than the detection limit.

### 3) Q-9 July 2019

The ninth post-injection quarterly sampling (Q-9) event occurred on July 24-25, 2019, approximately 32 months after the first injections (November 2016) and approximately 13 months after the extension injections (June 2018). During the July 2019 quarterly sampling event, groundwater samples were collected from 37 monitoring wells and analyzed for nitrate, nitrite, ammonia, total nitrogen, chloride, sulfate, DOC, dissolved iron, and dissolved manganese. Four monitoring wells were also analyzed for arsenic. Parameters, such as water level, pH, temperature, DO, ORP, conductivity, and turbidity, were also measured in the field. Additionally, water levels were collected from six monitoring wells outside of the core monitoring well network.

#### g) Assessment of Groundwater Flow Through the PRB July 2019

Groundwater elevations calculated from the July 2019 data were interpolated using Golden Software's Surfer program to develop groundwater contour lines (Figure 6, Figure 7, and Figure 8). These groundwater contour and flow direction interpretations continue to show a significant effect from local recharge and groundwater mounding in the parking lot area. Generally, groundwater flow is from west to east from the northern end of the soccer field and through the PRB to the parking lot area. Under the parking lot the flow direction shifts around to include localized flow to the south-southeast from the northern end of the parking lot where a large stormwater recharge gallery is located. There was approximately 1.75 inches of rainfall measured at Barnstable Municipal Airport (Weather Underground, 2019) on the two days prior to the July 2019 sampling event. These rainy conditions produced groundwater mounding and additional localized flow to the south. Groundwater chemistry data allows for additional interpretation of groundwater flow velocity based on transport DOC downgradient from the PRB, and downgradient changes in geochemistry as a result of PRB induced reducing conditions. The interpretation based on groundwater chemistry shows the average groundwater flow through the PRB is from west to east with a net groundwater velocity of 0.2 to 0.3 feet/day. Significant precipitation events resulting in stormwater recharge are likely to continue to induce periodic temporal changes in horizontal flow direction and may also affect vertical groundwater flow.

## h) Assessment of Groundwater Chemistry Data and PRB Performance

Nitrate concentration and additional groundwater chemistry data for baseline and quarterly sampling has been updated with data from the July 2019 sampling event and is included in Table 3. Nitrate data is also shown on cross-sections in Figures 3, Figure 4 and Figure 5. Graphs showing nitrate and DOC concentrations along with ORP are shown for selected monitoring wells in Chart 1 through Chart 10.

Overall assessment of PRB performance demonstrates that the PRB is effectively reducing significant nitrate concentrations, up to 39 mg/L, to low concentrations or to below the detection limits of 0.03 mg/L or 0.21 mg/L in the downgradient treated area. The observed treated area is expected to expand further downgradient with groundwater transport over time. Prior to the PRB extension injections in June 2018, data indicated effective PRB treatment downgradient of the November 2016 PRB section was limited to a wedge-shaped area bounded by the southeast to northwest oriented PRB section and including downgradient monitoring wells MW-B1010C (Chart 1), MW-B2010C (Chart 2), MW-B2020B (Chart 5), and MW-B2020C (Chart 6). These monitoring wells were close enough to the original southeast to northwest oriented PRB to be downgradient of the PRB in the easterly groundwater flow field.

Available data at the time of installation of the original section of PRB had indicated groundwater flow from southwest to northeast. The groundwater flow direction was later refined with data from additional monitoring well installations. The addition of the north-south PRB extension crossing the northwest end of the original PRB section has resulted in an expanded treatment area, extending to the north and affecting a significantly larger area including additional downgradient monitoring wells as discussed below. Data visualization heat maps showing the flow direction and concentration of nitrate in the vicinity of the PRB for shallow, intermediate and deep groundwater are shown in Figures 9, 10 and 11 respectively.

The effectiveness of PRB treatment is based on multiple lines of evidence including:

- Observation of the groundwater flow direction,
- Reduced concentrations of nitrate,
- Lower redox conditions (ORP) more favorable to denitrification, and
- Increased DOC concentrations indicating release of organic carbon from the PRB.

The last Quarterly data set from July 2019 was collected approximately 13 months following the PRB extension injections. Multiple lines of evidence as seen in Figures 9, 10, and 11, indicate treated groundwater has migrated more than 30 feet downgradient from the June 2018 PRB extension reaching monitoring wells MW-B1020B (Chart 3), MW-B1050A (Chart 7) and MW-B1050B (Chart 9). Limited evidence including a trend of lower nitrate concentration and decreased ORP observed at monitoring wells MW-B2050B and MW-B2050A also indicate treatment extending approximately 90 feet downgradient in intermediate and deep groundwater (see Chart 10 and Chart 8). The November 2016 PRB injections continue to affect treatment at shallow monitoring wells MW-B2010C (Chart 2) and MW-B2020C (Chart 6).

Additional observations were noted to develop a more complete understanding of groundwater flow dynamics and interpret performance data. Elevated concentrations of ammonia have been observed in monitoring well MW-B1075B, MW-BM050B, and MW-BN1, located further to the north near the Middle School septic system dosing chamber. The presence of ammonia may indicate a wastewater leak in the vicinity of the dosing chamber. July 2019 groundwater contours indicate some groundwater mounding at the northern end of the parking lot as a result of infiltration of stormwater. This mounding impact has lessened from the April 2019 sampling.

Secondary groundwater quality affects associated with PRB nitrate treatment are being monitored. Groundwater samples were collected for arsenic analyses from selected monitoring wells in September 2018 and January/April/July 2019. The September 2018 sampling included upgradient monitoring wells MW-4 and MW-BX2A, MW-BX2B, and MW-BX2C and monitoring wells MW-2010C and MW-2020B downgradient of the PRB. Of the six monitoring wells sampled and analyzed for arsenic, five were non-detect (<0.0025 mg/L). MW-B2010C, had an arsenic concentration of 0.059 mg/L which above the arsenic Massachusetts Maximum Contaminant Level (MMCL) groundwater standard 0.010 mg/L. MW-2010C is in the PRB treatment zone. Sample results indicate that the groundwater in the treatment zone is anaerobic under reducing condition with a negative oxidation-reduction potential and some mobilization of naturally occurring metals (iron, manganese and arsenic) is expected. These metals are also expected to precipitate downgradient where more aerobic conditions are encountered. Monitoring well MW-B2010C was retested for arsenic in January, April, and July 2019 and showed a similar concentration at 0.055, 0.087, and 0.09 mg/L, respectively. Monitoring wells located further downgradient, including nearby MW-2020B and monitoring wells MW-BC3B, MW-BC4A, MW-BC4B, and MW-BC4C were tested for arsenic in January 2019 and all showed less than the detection limit (<0.0025 mg/L), indicating arsenic had not migrated downgradient beyond the PRB treatment zone. MW-B2020B, MW-BC3B, and MW-BC4B were tested again in April and July 2019 and still all showed less than the detection limit.

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard  
Laboratory Director

**REVIEWED**

**By ESS Laboratory at 5:28 pm, Nov 13, 2019**

**Analytical Summary**

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

**Notes and Definitions**

- U Analyte included in the analysis, but not detected
- D Diluted.
- ND Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- MDL Method Detection Limit
- MRL Method Reporting Limit
- LOD Limit of Detection
- LOQ Limit of Quantitation
- DL Detection Limit
- I/V Initial Volume
- F/V Final Volume
- § Subcontracted analysis; see attached report
- 1 Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
- 2 Range result excludes concentrations of target analytes eluting in that range.
- 3 Range result excludes the concentration of the C9-C10 aromatic range.
- Avg Results reported as a mathematical average.
- NR No Recovery
- [CALC] Calculated Analyte
- SUB Subcontracted analysis; see attached report
- RL Reporting Limit
- EDL Estimated Detection Limit
- MF Membrane Filtration
- MPN Most Probably Number
- TNTC Too numerous to Count
- CFU Colony Forming Units

## ESS Laboratory Sample and Cooler Receipt Checklist

Client: AECOM Environment - ENSR - KPB/MM

ESS Project ID: 19K0140

Date Received: 11/6/2019

Project Due Date: 11/13/2019

Days for Project: 5 Day

Shipped/Delivered Via: ESS Courier

1. Air bill manifest present?  No  
Air No.: NA

2. Were custody seals present?  No

3. Is radiation count <100 CPM?  Yes

4. Is a Cooler Present?  Yes  
Temp: 4.1 Iced with: Ice

5. Was COC signed and dated by client?  Yes

6. Does COC match bottles?  Yes

7. Is COC complete and correct?  Yes

8. Were samples received intact?  Yes

9. Were labs informed about short holds & rushes?  Yes / No / NA

10. Were any analyses received outside of hold time? Yes /  No

11. Any Subcontracting needed? Yes /  No  
ESS Sample IDs: \_\_\_\_\_  
Analysis: \_\_\_\_\_  
TAT: \_\_\_\_\_

12. Were VOAs received?  Yes / No  
a. Air bubbles in aqueous VOAs?  Yes / No  
b. Does methanol cover soil completely? Yes / No / NA

13. Are the samples properly preserved? Yes / No  
a. If metals preserved upon receipt: Date: \_\_\_\_\_ Time: \_\_\_\_\_ By: \_\_\_\_\_  
b. Low Level VOA vials frozen: Date: \_\_\_\_\_ Time: \_\_\_\_\_ By: \_\_\_\_\_

Sample Receiving Notes:

No fines on COC

14. Was there a need to contact Project Manager? Yes /  No  
a. Was there a need to contact the client? Yes /  No  
Who was contacted? \_\_\_\_\_ Date: \_\_\_\_\_ Time: \_\_\_\_\_ By: \_\_\_\_\_

**RE: Orleans MA (60476644)**  
**ESS Laboratory Work Order Number: 19K0197**

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard  
Laboratory Director

**REVIEWED**  
*By ESS Laboratory at 3:04 pm, Nov 21, 2019*

**Analytical Summary**

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

Client Project ID: Orleans MA

ESS Laboratory Work Order: 19K0197

**SAMPLE RECEIPT**

The following samples were received on November 06, 2019 for the analyses specified on the enclosed Chain of Custody Record.

The samples and analyses listed below were analyzed in accordance with the Guidelines Establishing Test Procedures for the Analysis of Pollutants, 40 CFR Part 136, as amended.

**Revision 1 November 21, 2019: This report has been revised to include Dissolved Arsenic for 19K0197-07 and 19K0197-10.**

## ESS Laboratory Sample and Cooler Receipt Checklist

Client: AECOM Environment - ENSR - KP/MM

ESS Project ID: 19K0197

Date Received: 11/6/2019

Shipped/Delivered Via: ESS Courier

Project Due Date: 11/13/2019

Days for Project: 5 Day

1. Air bill manifest present?  No  
Air No.: NA
2. Were custody seals present?  No
3. Is radiation count <100 CPM?  Yes
4. Is a Cooler Present?  Yes  
Temp: 1.4 Iced with: Ice
5. Was COC signed and dated by client?  Yes

6. Does COC match bottles?  Yes
7. Is COC complete and correct?  Yes
8. Were samples received intact?  Yes
9. Were labs informed about short holds & rushes?  Yes /  No /  NA
10. Were any analyses received outside of hold time?  Yes /  No

11. Any Subcontracting needed? Yes  No   
ESS Sample IDs: \_\_\_\_\_  
Analysis: \_\_\_\_\_  
TAT: \_\_\_\_\_

12. Were VOAs received?  Yes /  No  NA  
a. Air bubbles in aqueous VOAs?  Yes /  No  NA  
b. Does methanol cover soil completely?  Yes /  No /  NA

13. Are the samples properly preserved?  Yes /  No  
a. If metals preserved upon receipt: Date: \_\_\_\_\_ Time: \_\_\_\_\_ By: \_\_\_\_\_  
b. Low Level VOA vials frozen: Date: \_\_\_\_\_ Time: \_\_\_\_\_ By: \_\_\_\_\_

Sample Receiving Notes:

14. Was there a need to contact Project Manager? Yes  No   
a. Was there a need to contact the client? Yes  No   
Who was contacted? \_\_\_\_\_ Date: \_\_\_\_\_ Time: \_\_\_\_\_ By: \_\_\_\_\_

*CERTIFICATE OF ANALYSIS*

Thomas Parece  
AECOM Environment - ENSR  
250 Apollo Drive  
Chelmsford, MA 01824

**RE: Orleans MA (60476644)**  
**ESS Laboratory Work Order Number: 19K0275**

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard  
Laboratory Director

**REVIEWED**  
*By ESS Laboratory at 3:54 pm, Nov 14, 2019*

**Analytical Summary**

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

Client Name: AECOM Environment - ENSR  
Client Project ID: Orleans MA

ESS Laboratory Work Order: 19K0275

**SAMPLE RECEIPT**

The following samples were received on November 07, 2019 for the analyses specified on the enclosed Chain of Custody Record.

**The samples and analyses listed below were analyzed in accordance with the Guidelines Establishing Test Procedures for the Analysis of Pollutants, 40 CFR Part 136, as amended.**

- 9014 - Cyanide
- 9038 - Sulfate
- 9040C - Aqueous pH
- 9045D - Solid pH (Corrosivity)
- 9050A - Specific Conductance
- 9056A - Anions (IC)
- 9060A - TOC
- 9095B - Paint Filter
- MADEP 04-1.1 - EPH
- MADEP 18-2.1 - VPH

**Prep Methods**

- 3005A - Aqueous ICP Digestion
- 3020A - Aqueous Graphite Furnace / ICP MS Digestion
- 3050B - Solid ICP / Graphite Furnace / ICP MS Digestion
- 3060A - Solid Hexavalent Chromium Digestion
- 3510C - Separatory Funnel Extraction
- 3520C - Liquid / Liquid Extraction
- 3540C - Manual Soxhlet Extraction
- 3541 - Automated Soxhlet Extraction
- 3546 - Microwave Extraction
- 3580A - Waste Dilution
- 5030B - Aqueous Purge and Trap
- 5030C - Aqueous Purge and Trap
- 5035A - Solid Purge and Trap

SW846 Reactivity Methods 7.3.3.2 (Reactive Cyanide) and 7.3.4.1 (Reactive Sulfide) have been withdrawn by EPA. These methods are reported per client request and are not NELAP accredited.

ESS Laboratory Work Order: 19K0275

**Notes and Definitions**

- U Analyte included in the analysis, but not detected
- D Diluted.
- ND Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- MDL Method Detection Limit
- MRL Method Reporting Limit
- LOD Limit of Detection
- LOQ Limit of Quantitation
- DL Detection Limit
- I/V Initial Volume
- F/V Final Volume
- § Subcontracted analysis; see attached report
- 1 Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
- 2 Range result excludes concentrations of target analytes eluting in that range.
- 3 Range result excludes the concentration of the C9-C10 aromatic range.
- Avg Results reported as a mathematical average.
- NR No Recovery
- [CALC] Calculated Analyte
- SUB Subcontracted analysis; see attached report
- RL Reporting Limit
- EDL Estimated Detection Limit
- MF Membrane Filtration
- MPN Most Probably Number
- TNTC Too numerous to Count
- CFU Colony Forming Units

# ESS Laboratory Sample and Cooler Receipt Checklist

AECOM Env - ENSR - KPB hdm 11/12/19

Client: ~~AEI Consultants, Inc. TB/MM~~

ESS Project ID: 19K0275  
 Date Received: 11/7/2019  
 Project Due Date: 11/14/2019  
 Days for Project: 5 Day

Shipped/Delivered Via: ESS Courier

- 1. Air bill manifest present?  No
- Air No.: NA
- 2. Were custody seals present?  No
- 3. Is radiation count <100 CPM?  Yes
- 4. Is a Cooler Present?  Yes  
 Temp: 0.1 Iced with: Ice
- 5. Was COC signed and dated by client?  Yes

- 6. Does COC match bottles?  Yes
- 7. Is COC complete and correct?  Yes
- 8. Were samples received intact?  Yes
- 9. Were labs informed about short holds & rushes?  Yes / No / NA
- 10. Were any analyses received outside of hold time?  Yes / No

11. Any Subcontracting needed?  No  
 ESS Sample IDs: \_\_\_\_\_  
 Analysis: \_\_\_\_\_  
 TAT: \_\_\_\_\_

12. Were VOAs received?  Yes / No  
 a. Air bubbles in aqueous VOAs?  Yes / No  
 b. Does methanol cover soil completely?  Yes / No / NA

13. Are the samples properly preserved?  Yes / No  
 a. If metals preserved upon receipt: Date: \_\_\_\_\_ Time: \_\_\_\_\_ By: \_\_\_\_\_  
 b. Low Level VOA vials frozen: Date: \_\_\_\_\_ Time: \_\_\_\_\_ By: \_\_\_\_\_

Sample Receiving Notes:

14. Was there a need to contact Project Manager?  Yes / No  
 a. Was there a need to contact the client?  Yes / No  
 Who was contacted? \_\_\_\_\_ Date: \_\_\_\_\_ Time: \_\_\_\_\_ By: \_\_\_\_\_
